

IIS Rewrite URL - basepath

When you write a rewrite URL, and there is a subfolder, you will end up that the target application might not know how to manage the relative paths.

1) Write in the App.razor some code to receive the BasePath

A screenshot of a code editor showing the App.razor file. The code is as follows:

```
<html lang="en">
<head>
  @code
  {
    [SupplyParameterFromQuery]
    public string? basePath { get; set; }
  }
  <base href="/@basePath" />
```

2) In the rewrite rule append the basepath

Name:

Laklijn test HTTP

Match URL

Requested URL:

Matches the Pattern

Using:

Regular Expressions

Pattern:

(.*)laklijn/(.*)

Test pattern...

☒ Ignore case

Conditions

Server Variables

Action

Action type:

Rewrite

Action Properties

Rewrite URL:

http://localhost:35/{R:2}?basePath=laklijn/

☒ Append query string

☒ Log rewritten URL

☒ Stop processing of subsequent rules

<html lang="en">
... <head> == \$0
<base href="/laklijn/">
<meta charset="utf-8">
