

# IIS Rewrite URL - basepath

When you write a rewrite URL, and there is a subfolder, you will end up that the target application might not know how to manage the relative paths.

1) Write in the App.razor some code to receive the BasePath

A screenshot of a code editor showing the App.razor file. The code is as follows:

```
<html lang="en">
<head>
  @code
  {
    [SupplyParameterFromQuery]
    public string? basePath { get; set; }
  }
  <base href="/@basePath" />
```

2) In the rewrite rule append the basepath

Name:

Laklijn test HTTP

### Match URL

Requested URL:

Matches the Pattern

Using:

Regular Expressions

Pattern:

(.\*)laklijn/(.\*)

Test pattern...

☒ Ignore case

### Conditions

### Server Variables

### Action

Action type:

Rewrite

#### Action Properties

Rewrite URL:

http://localhost:35/{R:2}?basePath=laklijn/

☒ Append query string

☒ Log rewritten URL

☒ Stop processing of subsequent rules

```
<html lang="en">
... <head> == $0
  <base href="/laklijn/">
  <meta charset="utf-8">
```
