Link subdomain to docker (NGINX)

This section assumes an NGINX docker and you have setup your DNS to connect to you NAS via a wildcard.

1) Enable Telnet on the NAS in Control Panel

2) Telnet into the NAS, I prefer putty

3) cd into the folder you can easily access or edit (in my case, a network shared folder, execute, in the terminal screen "docker ps" to find the id of your container

```
docker ps
```

```
docker  cp c0568abcdb83916:/etc/nginx/nginx.conf tmp_tim.conf
```

then edit, the config file for nginx, and do the reverse:

```
docker  cp tmp_tim.conf  c0568abcdb83916:/etc/nginx/nginx.conf
```

Restart the container.
